TITLE: Distribution of the concentration and density of a particle flux near a small body moving in a rarefied plasma

SOURCE: Geomagnetizm i aeronomiya, v. 6, no. 6, 1966, 997-1007

TOPIC TAGS: rarefied plasma, plasma density, particle beam

ABSTRACT: Formulas are derived for calculating the distribution of density and concentration of a particle flux near a body moving in a highly rarefied plasma. Dimensions of the body are considered small in comparison to the Debye length. For the sake of simplicity, potential on the surface of the body is assumed to be negative, with the result that ions are attracted to the body. It is also assumed that the incident ions are fully neutralized on the surface of the body. Particular cases are considered in which: 1) the velocity of the body is small in comparison to the thermal velocity of ions, 2) the body moves at arbitrary velocities, and 3) the velocity of the body is greater than the thermal velocity of ions.

B

TITLE: A viscometer for measuring the viscosity of aggressive melts

SOURCE: Ref. zh. Metrologiya i izmeritel'naya tekhnika, Abs. 5.32.715

REF SOURCE: Khim. prom-st'. Inform. nauk.-tekhn. zb., no. 4(24), 1965, 71-72

TOPIC TAGS: viscosimeter, tin plating, fluid viscosity

ABSTRACT: The authors describe a viscometer developed for measuring the viscosity of aggressive tinning melts over a wide range (from tenths of a centipoise to several hundred poises) at temperatures up to 600°C and pressures up to 25 atm. The instrument may be used for studying materials which undergo thermal dissociation. The falling ball method is used for determining high viscosity and the rolling ball method is used for determining low viscosity. Induction pickups are used to register the time required for the ball to pass through a given distance. An oscillograph is used for recording the resultant signals. 1 illustration, bibliography of 4 titles, P. Agaletskiy. [Translation of abstract]

TITLE: Natural and synthetic plant growth and development regulators. B. Mechanism of Growth Retardant Action

SOURCE: Kosmos - Series A (Biologia), no. 4, 1966, 369-386

TOPIC TAGS: plant growth regulator, plant growth retardant, organic compound, physiologically active compound, auxin, giberellin

ABSTRACT: The possibility of natural and synthetic plant growth regulators serving as giberellin antagonists was investigated in the course of amassing data on growth retardants. Only the better known retardants, namely AMO-1618, B995, Phosphon D, and MH were studied with regard to the activities of these growth retardants as competitive antagonists of giberellins, regulators of auxin metabolism, and for their retardant action independent of GA and IAA. Nothing certain is known about retardant action, but present experimental data make it possible to assume that molecular

Card 1/3

Card 2/3

L 04534-67

ACC NR: AP8030309

action mechanisms differ with each retardant, because of their differing chemical structures, but that all ultimately act at the endogenous auxin level. Auxins and perhaps also giberellins control the process of genetic information contained in plant cell DNA. Possibly several retardants impede auxin synthesis, and so lead to an imbalance between auxins and giberellins, thereby retarding growth. Giberellin and auxin biosynthesis in higher plants incorporating studies of general giberellin and auxin synthesis in vivo and in vitro studies of the effects of various enzymes upon biosynthetic cycles are planned. This will help clarify the action mechanism of growth retardants. Orig. art. has: 7 figures. [W.A.S.] [DR]

TITLE: Automatic ~~Electric~~ Welding of Large Diameter Cones (Avtomaticheskay elektrosvarka konusov bol'shogo diametera)

PERIODICAL: Svarochnoye Proizvodstvo, 1958, Nr 1, p 38 (USSR)

ABSTRACT: Cones of large diameters, made of sheet steel, are basic structural parts of separators and cyclones. The Chernovitsy Machine Building Plant's technology for cone construction is fully described and illustrated. The process has the following advantages: 1) panel assembly is mechanized without tack welding on a magnetic stand; 2) labour consumption is reduced by 50 %; 3) The utilization of uniform sheet sizes reduces the amount of weld metal by 50 - 60 %; 4) A proper and precise cone shape is obtained. The plant designed an electro-magnetic stand for the assembly and a bracket-revolving device for the automatic welding of the parts. There are 4 figures and 1 photo.

TITLE: The Metallization of Disks for Deaeration Columns.

PERIODICAL: Mashinostroitel', 1959, Nr 4, p 30 (USSR)

ABSTRACT: This is a brief description of a special work place for aluminum-spraying of perforated disks for deaeration towers, organized at the Chernovitskiy mashinostroitel'nyy zavod (Chernovitsy Machine Building Plant). There are two work chambers and a telfer handling the disks. A disk is attached to a manipulator in the chamber. The manipulator is rotated by a motor and controlled from a control panel. The operator stands outside the chamber holding only his hands inside during the process of sand-blasting and metallizing. There is 1 drawing.
